INFORMATION TO USERS

This was produced from a copy of a document sent to us for microfilming. While the most advanced technological means to photograph and reproduce this document have been used, the quality is heavily dependent upon the quality of the material submitted.

The following explanation of techniques is provided to help you understand markings or notations which may appear on this reproduction.

1. The sign or "target" for pages apparently lacking from the document photographed is "Missing Page(s)". If it was possible to obtain the missing page(s) or section, they are spliced into the film along with adjacent pages. This may have necessitated cutting through an image and duplicating adjacent pages to assure you of complete continuity.

2. When an image on the film is obliterated with a round black mark it is an indication that the film inspector noticed either blurred copy because of movement during exposure, or duplicate copy. Unless we meant to delete copyrighted materials that should not have been filmed, you will find a good image of the page in the adjacent frame.

3. When a map, drawing or chart, etc., is part of the material being photographed the photographer has followed a definite method in "sectioning" the material. It is customary to begin filming at the upper left hand corner of a large sheet and to continue from left to right in equal sections with small overlaps. If necessary, sectioning is continued again—beginning below the first row and continuing on until complete.

4. For any illustrations that cannot be reproduced satisfactorily by xerography, photographic prints can be purchased at additional cost and tipped into your xerographic copy. Requests can be made to our Dissertations Customer Services Department.

5. Some pages in any document may have indistinct print. In all cases we have filmed the best available copy.

CONVERGENCE THEOREMS FOR LINEAR EVOLUTION EQUATIONS

A Dissertation

Submitted to the Graduate Faculty of the Louisiana State University and Agricultural and Mechanical College in partial fulfillment of the requirements for the degree of Doctor of Philosophy in The Department of Mathematics

by

Mary Jorgensen Anderson
B.S., Louisiana State University, 1965
M.S., Louisiana State University, 1968
August, 1979
ACKNOWLEDGEMENT

This dissertation was prepared under the direction of Dr. J.R. Dorroh. The author wishes to express her appreciation for the invaluable aid and assistance rendered by Dr. Dorroh in the preparation of this dissertation. She also wishes to express her appreciation to her husband, Dr. E.H. Anderson, without whose help it would never have been written.

The differential equations
\[ u'(t) = A(t)u(t), \ a \leq t \leq b \]
and
\[ u'(t) - A(t)u(t) = f(t), \ a \leq t \leq b \]
where \( \{A(t): a \leq t \leq b\} \) is a family of unbounded linear operators in a Banach space \( X \), are studied under the hypotheses that a weak evolution system exists, or that approximate solutions to the differential equation exist.

Given that \( \{A_n(\cdot)\}_{n=1}^{\infty} \) is a sequence of strongly measurable functions from \([a,b]\) into \( B(Y,X) \) with norm \( ||A_n(\cdot)||_{Y,X} \) bounded above by an integrable function for each \( n \), and that \( \{A_n(\cdot)\} \) converges strongly almost everywhere to \( A(\cdot) \), where \( U_n(\cdot,\cdot) \) is a proper evolution system generated by \( A_n(\cdot) \), \( u_n(t) \) represents the solution to the corresponding differential equation for each \( n \), \( U(\cdot,\cdot) \) is the proper evolution system generated by \( A(\cdot) \) with \( u(t) \) the solution to this differential equation, then sufficient conditions are developed under which \( U_n \) converges to \( U \), and sufficient conditions are also found for \( u_n(t) \) to converge to \( u(t) \).
INTRODUCTION

This dissertation is concerned with the differential equations
\[ u'(t) = A(t)u(t), \quad a \leq t \leq b, \]
and
\[ u'(t) - A(t)u(t) = f(t), \quad a \leq t \leq b. \]

J.R. Dorroh and R.A. Graff, in a paper entitled Integral equations in Banach spaces \([3]\), demonstrated the existence and uniqueness of an evolution system generated by a family \(\{A(t): a \leq t \leq b\}\) of unbounded operators in a Banach space \(X\) when a weak evolution system exists, and when approximate solutions to the differential equation exist.

In the two papers entitled Linear evolution equations of "hyperbolic" type \([7]\), and Linear evolution equations of "hyperbolic" type, II \([8]\), Tosio Kato dealt with the subject of evolution systems where the generating family \(\{A(t)\}\) meets other conditions: in \([7]\) the hypothesis is that the family \(\{A(t)\}\) is stable, and in \([8]\) the hypothesis is weakened to quasi-stability.

In \([8]\) Kato gave several theorems concerning convergence of evolution systems and convergence of solutions, when families of differential equations exist. Here we present some results similar to those of Kato, but under the hypotheses of Dorroh and Graff in \([3]\).
In this chapter, the background material needed in this dissertation is presented. A basic familiarity with Banach spaces and semigroups of operators is assumed. General references dealing with these areas are Butzer and Berens [1], Dunford and Schwartz [4], Hille and Phillips [5], Ladas and Lakshmikantham [9], and Yosida [11].

We will employ the following notation and make the following assumptions throughout Chapters 1, 2, and 3. Let $X$ and $Y$ be Banach spaces, with $Y$ densely and continuously included in $X$. We denote by $B(Y,X)$ the set of all bounded linear operators from $Y$ into $X$. Let $a < b$, and $I$ denote the interval $[a,b]$. Let $A:[a,b] \to B(Y,X)$ be strongly measurable; i.e., $A(\cdot)y$ is a measurable function from $[a,b]$ into $X$ for each $y \in Y$. Let $\Delta$ be the subset of $I \times I$ defined by $\Delta = \{(t,s): a \leq s \leq t \leq b\}$.

Several different norms are used, so for clarity they will be subscripted as follows: $\| \cdot \|_X$ is the norm in the Banach space $X$, $\| \cdot \|_Y$ is the norm in the Banach space $Y$, and $\| \cdot \|_{Y,X}$ denotes the operator norm in $B(Y,X)$. If the meaning is clear from context, the subscript may be omitted. $L^1(X)$ consists of all measurable functions $f$
defined on \([a,b]\) into \(X\) which are such that \(\|f(t)\|_X\) is integrable, with \(\|f\|_1, X = \int_a^b \|f(t)\|_X dt\).

For \(f: I \to X\), we write \(\|f\|_{\infty, X} = \text{ess sup}_{t \in I} \|f(t)\|_X\).

Also \(\int_I f(t) dt\) denotes the upper-integral of \(f\), and \(f'(t)\) denotes the derivative of \(f\) with respect to \(t\). We say \(f\) is absolutely continuous on \(I\) if given \(\varepsilon > 0\) there is a \(\delta > 0\) such that \(\sum_{i=1}^{n} \|f(t_i') - f(t_i)\|_X < \varepsilon\) for every finite collection \([t_i, t_i']\): \(i = 1, 2, \ldots, n; t_i, t_i' \in I\) of nonoverlapping intervals with \(\sum_{i=1}^{n} [t_i' - t_i] < \delta\). It is sometimes necessary to denote the norm used for a particular property; for example, \(X - \text{absolutely continuous}\) will mean absolutely continuous with respect to the norm of the space \(X\).

The following definitions and statements are taken from Dorroh and Graff [3].

**Definition 1.1.** An \(\varepsilon\) - approximate solution of the differential equation

\[u'(t) = A(t)u(t), u(a) = y \in Y\]

on the interval \([a,b]\) is a bounded measurable function \(v\) from \([a,b]\) into \(Y\) which is \(X - \text{absolutely continuous}\) and \(X - \text{differentiable a.e.}\) on \([a,b]\), with \(v(a) = y\), and

\[\int_a^b \|v'(t) - A(t)v(t)\|_X dt < \varepsilon.\]

If \(v'(t) = A(t)v(t)\) a.e. on \([a,b]\), then \(v\) is a solution of the differential equation.

**Definition 1.2.** A weak evolution system generated by \(A(\cdot)\) is a bounded function \(U\) from \(\Delta\) into \(B(X, X^{**})\) such that \(U(a,a,\cdot) = I\), the identity function, and such that if
a < t ≤ b, then \( U(t, \cdot) \) is a weak solution of the differential equation

\[
Q'(s) = -Q(s)A(s)
\]
on the interval \([0,t]\).

**Definition 1.3.** A proper evolution system is a function \( U \) from \( \Delta \) into \( B(X) \) which satisfies

\[
U(t,t) = I, \quad U(t,s)U(s,r) = U(t,r)
\]
for \( a ≤ r ≤ s ≤ t ≤ b \). A proper evolution system generated by \( A(\cdot) \) is a weak evolution system generated by \( A(\cdot) \) which is also a proper evolution system. A strongly continuous evolution system is one in which the function \((t,s) \rightarrow U(t,s)x\) is jointly continuous from \( \Delta \) into \( X \) for each \( x \in X \).
CHAPTER 2
OPERATOR VOLterra EQUATIONS

Let \( a < b \), and let \( \Delta = \{(t,s): a < s < t < b\} \). Let \( X \) denote a Banach space, let \( K \) denote the collection of all strongly continuous functions from \( \Delta \) into \( B(X) \) and let \( M \) denote the collection of all essentially bounded strongly measurable functions from \([a,b]\) into \( X \). Then \( K \) is a Banach space under the norm
\[
\|U\|_\infty = \sup_{(t,s) \in \Delta} \|U(t,s)\|_{X,X}
\]
and \( M \) is a Banach space under the norm
\[
\|B\|_\infty = \text{ess sup}_{t \in [a,b]} \|B(t)\|_{X,X}
\]

If \( U, V \in K \) and \( B \in M \), then we define \( UBV \in K \) by
\[
(UBV)(t,r) = \int_r^t U(t,s)B(s)V(s,r)\,ds,
\]
where the integral is in the strong operator topology. See [8, Lemma 1, p. 654]; the integrand is strongly measurable by [8, Lemma A4, p. 665].

The following theorem shows that the convolution operation defined above by (1) is associative.

**Theorem 2.1.** \( UB (VDW) = (UBV) DW \) for \( U, V, W \in K \) and \( B, D \in M \).

**Proof:**
\[
UB (VDW) = \int_\sigma^T U(t,s)B(s)[\int_\sigma^S V(s,r)D(r)W(r,\sigma)\,dr]\,ds
\]
= \int_\sigma^T \int_\sigma^S U(t,s)B(s)V(s,r)D(r)W(r,\sigma)dr \, ds

(where r < s, and r goes from \sigma to \tau)

= \int_\sigma^T \int_\sigma^T U(\tau,s)B(s)V(s,r)D(r)W(r,\sigma)ds \, dr

(by Fubini's Theorem [4])

= \int_\sigma^T [\int_\sigma^T U(\tau,s)B(s)V(s,r)ds] D(r)W(r,\sigma)dr

= \int_\sigma^T (UBV)(t,r)D(r)W(r,\sigma)dr

= (UBV) \, DW. \quad //

If U, V \in K and B \in M, then we can consider the following two Volterra integral equations

(2) \ W(t,r) = V(t,r) + \int_\tau^t U(t,s)B(s)W(s,r)ds

(3) \ W(t,r) = V(t,r) + \int_\tau^t W(t,s)B(s)U(s,r)ds

where the solution W is sought in K. These equations can be rewritten in terms of the convolution product we have just defined as

(2') \ W = V + UBW

(3') \ W = V + WBU.

It is convenient to define, for U \in K and B \in M, the linear operator \{UB\} and \{BU\} from K into K by

(4) \ \{UB\}W = UBW, \quad \{BU\}W = WBU.

Thus (2) and (3) can also be rewritten as

(2'') \ W = V + \{UB\}W

(3'') \ W = V + \{BU\}W.

The solutions to these equations can then be found using standard techniques, as shown in Theorem 2.2. First we need the following lemma.
Lemma 2.2.1. Let $U, V \in K$ and $B \in M$. Then for each $n$, 

$$\|\{UB\}^n V\|_\infty \leq \frac{1}{n!} \|U\|_\infty^n \|B\|_{1,X}^n \|V\|_\infty.$$ 

Also $$\|\{BU\}^n V\|_\infty \leq \frac{1}{n!} \|U\|_\infty^n \|B\|_{1,X}^n \|V\|_\infty.$$ 

Proof: Let $\beta$ be an integrable function dominating $\|B(\cdot)\|$ on $[a,b]$. 

$$\|\{UB\}V\|_\infty = \|\int_r^t U(t,s)B(s)V(s,r)ds\|_\infty \leq \|U\|_\infty \|V\|_\infty \int_r^t \beta(s)ds.$$ 

(1) $$\|\{UB\}^n V\|_\infty \leq \|U\|_\infty^n \|V\|_\infty \int_r^t \beta(s_1)\cdots \beta(s_n)ds_1\cdots ds_n.$$ 

(2) $$\int_r^t \beta(s_1)\cdots \beta(s_n)ds_1\cdots ds_n = \frac{1}{n!} [\int_r^t \beta(s)ds]^n.$$ 

This equation may be "seen geometrically" as follows. 

The region of integration in the first integral is an $n$-dimensional pyramid. The $n$-dimensional box $[r,t]^n$ is composed of the $n$-factorial pyramids obtained by permuting the $s_i$'s; e.g. $\{r \leq s_2 \leq s_1 \leq s_3 \leq \cdots \leq s_n \leq t\}$. Clearly the integrals over these pyramids are equal, and the integral over the box is $[\int_r^t \beta(s)ds]^n$. 

Since (1) and (2) are true for any integrable function dominating $\|B(\cdot)\|_{X,X'}$ we have 

$$\|\{UB\}^n V\|_\infty \leq \frac{1}{n!} \|U\|_\infty^n \|B\|_{1,X}^n \|V\|_\infty.$$ 

The second inequality in the lemma follows by the same argument. //
Theorem 2.2. The solutions of (2) and (3) are

\[ W = \sum_{n=0}^{\infty} (UB)^n V, \quad W = \sum_{n=0}^{\infty} (BU)^n V, \]

respectively, where both of the series converge in operator norm.

Proof: \[ W = V + (UB)W \]

\[ V = (I - (UB))W \]

\[ W = (I - (UB))^{-1}V \]

is the solution of (2).

Similarly, \[ W = (I - (BU))^{-1}V \]

is the solution of (3). We can formally write Neumann expansions

\[ (I - (UB))^{-1} = \sum_{n=0}^{\infty} (UB)^n, \]

\[ (I - (BU))^{-1} = \sum_{n=0}^{\infty} (BU)^n. \]

From the lemma we have

\[ \| (UB)^n V \|_\infty \leq \frac{1}{n!} \| U \|_\infty^n \| B \|_1^n, \]

and \[ \| (BU)^n V \|_\infty \leq \frac{1}{n!} \| U \|_\infty^n \| B \|_1^n. \]

Therefore \( (UB) \) and \( (BU) \) are bounded operators and

\[ \| (UB)^n \|, \| (BU)^n \| \leq \frac{1}{n!} \| U \|_\infty^n \| B \|_1^n. \]

Then,

\[ \sum_{n=0}^{\infty} \| (UB)^n \|, \sum_{n=0}^{\infty} \| (BU)^n \| \leq e \| U \|_\infty \| B \|_1, \]

so both series converge in operator norm. //

We now prove in Theorem 2.3 that under certain conditions, equations (2) and (3) will have the same solutions.

Theorem 2.3. If \( U, V, P \in K, \ B \in M, \) and \( UBP = PBV, \) then the equations \( W = P + UBW; \) \( W = P + WBV \) have the same solution.

Proof: Since the solutions to the above equations can be written \( (I - (UB))^{-1}P \) and \( (I - (BV))^{-1}P \) respectively, we
need to show that these are equal. This can be seen as follows:

\[ [I - \{UB\}]^{-1}P = P + \{UB\}P + \{UB\}^2P + \ldots \]
\[ = P + PBV + UB(PBV) + \ldots \]
\[ = P + PBV + (UBP)BV + \ldots \]
\[ = P + PBV + (PBV)BV + \ldots \]
\[ = P + \{BV\}P + \{BV\}^2P + \ldots \]
\[ = [I - \{BV\}]^{-1}P. // \]

In particular, the equations \( W = U + UBW \), \( W = U + WBU \) have the same solution for any \( U \in K \) and \( B \in M \).

Recall that an element \( U \) of \( K \) is a proper evolution system if

\[ U(t,s)U(s,r) = U(t,r) \]
for \( (t,s), (s,r) \in A \), and \( U(t,t) = I \) for \( t \in [a,b] \).

If, in the equation \( W = U + WBU \), \( U \) is an evolution system, then the solution \( W = [I - \{BU\}]^{-1}U \) is also an evolution system, as shown in the following theorem, which is essentially contained in Theorem 2.12 of [3].

**Theorem 2.4.** If \( U \) is an evolution system, and \( B \in M \), then \( [I - \{BU\}]^{-1}U \) is an evolution system; thus, \( [I - \{UB\}]^{-1}U \) is also an evolution system.

**Proof:** Let \( W = [I - \{BU\}]^{-1}U \), then \( W = U + WBU \). It is obvious that \( W(t,t) = I \) for \( t \in [a,b] \). Let \( \tau \in [a,b] \), and define \( Z \) on \( A \) by

\[ Z(t,r) = \begin{cases} 
W(t,r) & \text{if } \tau \leq r \leq t \leq b \\
W(t,\tau)W(\tau,r) & \text{if } a < r < \tau \leq t < b \\
W(t,r) & \text{if } a \leq r \leq t \leq \tau.
\end{cases} \]
Then $Z$ is strongly continuous from $A$ to $B(X)$. We want to show that $Z = U + ZBU$. This will imply that $Z = W$, which will imply that $W(t, \tau)W(\tau, r) = W(t, r)$ for $a \leq r < \tau < t \leq b$. Since $\tau$ was arbitrary, this will prove that $W$ is an evolution system. If $a \leq r < t < b$, or $\tau < r < t \leq b$, then it is clear that $Z(t, r) = [U + ZBU](t, r)$.

If $a \leq r < t < b$, then

$$W(t, \tau) = U(t, \tau) + \int_\tau^t W(t, s)B(s)U(s, \tau)ds,$$

$$W(\tau, r) = U(\tau, r) + \int_\tau^r W(\tau, s)B(s)U(s, r)ds,$$

$$W(t, \tau)W(\tau, r) = U(t, r) + \int_\tau^t W(t, s)B(s)U(s, r)ds$$

$$\quad + \int_\tau^r W(t, \tau)W(\tau, s)B(s)U(s, r)ds$$

$$\quad = U(t, r) + \int_\tau^r Z(t, s)B(s)U(s, r)ds.$$

Thus we have $Z = U + ZBU$, which completes the proof. //
CHAPTER 3
CONVERGENCE THEOREMS

The theorems which follow extend theorems III, IV, Va, VI, and VIa in Kato's paper Linear evolution equations of hyperbolic type, II [8] to the situation where the differential equation has \( \varepsilon \)-approximate solutions for every \( \varepsilon > 0 \), instead of under the assumption of quasi-stability.

Throughout this chapter, assume that the differential equation

\[
 u'(t) = A(t)u(t)
\]

has approximate solutions, where \( A(\cdot) \) is a strongly measurable function from \([a,b]\) into \( B(Y,X) \), and let \( U(\cdot,\cdot) \) be a strongly continuous proper evolution system generated by \( A(\cdot) \). For conditions under which such evolution systems exist, see [3].

Let \( \{A_n(\cdot)\}_{n=1}^{\infty} \) be a sequence of strongly measurable functions from \([a,b]\) into \( B(Y,X) \) and \( \{\alpha_n\}_{n=1}^{\infty} \) a uniformly integrable sequence of integrable nonnegative functions on \([a,b]\) such that \( \alpha_n \) dominates \( ||A_n(\cdot)||_{Y,X} \) for each \( n \).

Also assume that if \( y \in Y \), then \( \{A_n(\cdot)y\} \) converges a.e. on \([a,b]\) to \( A(\cdot)y \), and that \( \alpha \) is an integrable nonnegative function on \([a,b]\) which dominates \( ||A(\cdot)||_{Y,X} \). For each \( n \), let \( U_n(\cdot,\cdot) \) be a proper evolution system generated by
A_n(\cdot), where \|U_n(t,s)\|_{X,X} is uniformly bounded for (t,s) \in \Delta and n=1, 2, 3, \ldots.

It was shown by Dorroh and Graff in Theorem 2.15 of [3] that this implies that

\[ \lim_{n \to \infty} \|U_n(t,s)x - U(t,s)x\|_X = 0 \]

for each \(x \in X\) and \(s \in [a,b]\), uniformly for \(s \leq t \leq b\).

Now consider the nonhomogeneous equation

\[ u'(t) - A(t)u(t) = f(t), \quad u(a) = \phi \]

The "mild solution" of (2) can be formally written

\[ u(t) = U(t,a)\phi + \int_a^t U(t,s)f(s)\,ds. \]

In general, \(u\) need not be a solution of (2) in the strict sense. Also we have the equations

\[ u'_n(t) - A_n(t)u_n(t) = f_n(t), \quad u_n(a) = \phi_n \]

with formal solutions

\[ u_n(t) = U_n(t,a)\phi_n + \int_a^t U_n(t,s)f(s)\,ds. \]

The following theorem gives an estimate of the difference between \(u_n(t)\) and \(u(t)\).

**Theorem 3.1.** Let \(\phi, \phi_n \in X\) and \(f, f_n \in L_1(X)\). Then

\[ \|u_n(t) - u(t)\|_{\infty,X} \leq K[\|\phi_n - \phi\|_X + \|f_n - f\|_{1,X}] + M\|U_n - U\|_{\infty,X}, \]

where \(K\) and \(M\) depend only on the norms of \(U_n, \phi,\) and \(f\).

**Proof:**

\[ u_n(t) - u(t) = U_n(t,a)\phi_n - U(t,a)\phi \]

\[ + \int_a^t [U_n(t,s)f_n(s) - U(t,s)f(s)]\,ds \]

\[ = U_n(t,a)(\phi_n - \phi) + \int_a^t U_n(t,s)[f_n(s) - f(s)]\,ds \]

\[ + [U_n(t,s) - U(t,s)]\phi + \int_a^t [U_n(t,s) - U(t,s)]f(s)\,ds, \]

so

\[ \|u_n - u\|_{\infty,X} \leq \|U_n\|_{\infty,X} [\|\phi_n - \phi\|_X + \|f_n - f\|_{1,X}] \]

\[ + \|U_n - U\|_{\infty,X} [\|\phi\|_X + \|f\|_{1,X}]. \]
Let \( K = \|U_n\|_{\infty, X} \) and \( M = \|\phi\|_X + \|f\|_{1, X} \), then the result follows. //

Now we present some conditions under which \( u_n(t) \) will converge to \( u(t) \).

**Theorem 3.2.** If in addition \( \phi_n \to \phi \) in \( X \) and \( f_n \to f \) in \( L_1(X) \) then \( u_n \to u \) in \( X \).

**Proof:** From Theorem 3.1 we have
\[
\|u_n(t) - u(t)\|_X \leq \|U_n\|_{\infty, X}[\|\phi - \phi\|_X + \|f_n - f\|_{1, X}] \\
+ \int_a^t \|U_n(t,s) - U(t,s)\|_X ds \\
+ \int_a^t \|U_n(t,s)f(s) - U(t,s)f(s)\|_X ds.
\]

By hypothesis, \( \|\phi - \phi\|_X = 0 \) and \( \|f_n - f\|_{1, X} = 0 \). Also \( \|U_n(t,s) - U(t,s)\|_X = 0 \) by (1) above. Since \( U_n(t,s) \) is uniformly bounded, we have that \( U_n(t,s)f(s) \) forms a uniformly integrable family of functions and so, by a generalization of Lebesque's theorem, \( U_n(t,s)f(s) \) converges to \( U(t,s)f(s) \) in \( L_1 \) norm (see [10] p. 17, 18).

Thus \( \|u_n(t) - u(t)\|_X \to 0. // 

For the rest of the chapter, assume further that the following version of Kato's condition (ii'') of [8] is satisfied.

(ii'') There is a family \( \{S(t) : a \leq t \leq b\} \) of isomorphisms of \( Y \) onto \( X \), a strongly measurable function \( B(t) \) from \([a,b]\) into \( B(X) \) with \( \|B(\cdot)\|_{X,X} \) upper-integrable (i.e., bounded above by an integrable function), and a strongly measurable function \( \dot{S} \) from \([a,b]\) into \( B(Y,X) \) with \( \|\dot{S}(\cdot)\|_{Y,X} \) upper-integrable such that \( S \) is a strong indefinite integral of \( \dot{S} \), and such that if \( y \in Y \), then
$S(t)A(t)S(t)^{-1}_y = A(t)y + B(t)y$
a.e. on $[a,b]$.

Then it was shown in Theorem 2.13 of [3] that $U(t,s) \in B(Y)$ for each $(t,s) \in \Delta$ and $U(\cdot,\cdot)y$ is jointly continuous from $\Delta$ into $Y$ for each $y \in Y$.

The next theorem presents some properties of $S(\cdot)$ and $S(\cdot)^{-1}$ which are needed for Theorem 3.4.

**Theorem 3.3.** $S(\cdot)$ and $S(\cdot)^{-1}$ are continuous (in fact, absolutely continuous) with $||S(\cdot)||_{Y,X}$ and $||S(\cdot)^{-1}||_{X,Y}$ bounded.

**Proof:** We have $||S(\cdot)||_{Y,X}$ upper-integrable on $I$ (i.e., bounded above by $\beta(t)$, which is integrable) and $S$ equal to an indefinite strong integral of $\dot{S}$. Then

$$||S(t) - S(s)||_{Y,X} \leq \int_s^t ||\dot{S}(r)||_{Y,X} dr \leq \int_s^t \beta(r)dr$$

which approaches zero as $|t - s| \to 0$. Thus $S(\cdot)$ is continuous from $[a,b] \to B(Y,X)$ and $[a,b]$ compact implies $||S(\cdot)||$ is bounded. Since $S(\cdot)$ is continuous, we have $S(\cdot)^{-1}$ continuous with $||S(\cdot)^{-1}||_{X,Y}$ bounded.

Suppose $||S(\cdot)^{-1}|| \leq M$. From above we have

$$||S(t_j) - S(s_j)|| \leq \sum_{j=1}^{J} \int_{s_j}^{t_j} \beta(r)dr, \text{ so } \Sigma||S(t_j) - S(s_j)|| \leq \Sigma \int_{s_j}^{t_j} \beta(r)dr$$

which approaches zero as $\Sigma(t_j - s_j)$ approaches zero. Then $\Sigma||S(t_j)^{-1} - S(s_j)^{-1}||$

$$\leq \Sigma||S(t_j)^{-1}|| ||S(s_j) - S(t_j)|| ||S(s_j)^{-1}||$$

$$\leq M^2 \Sigma||S(s_j) - S(t_j)||$$

which also approaches zero as $\Sigma(t_j - s_j)$ approaches zero.

Thus $S(\cdot)$ and $S(\cdot)^{-1}$ are absolutely continuous in operator norm. //
Now, define $C$ from $[a,b]$ into $B(X)$ by

$$C(t) = S(t)S(t)^{-1}.$$  Then $C$ is strongly measurable with $||C(\cdot)||_{X,X}$ upper-integrable. Define $W$ from $\Delta$ into $B(X)$ by means of the Volterra-type integral equation

$$W(t,r)x = U(t,r)x + \int_r^t W(t,s)[B(s) + C(s)]U(s,r)xds$$

(see [2] pp. 475-477, [8] pp. 652,653). Then, we have

$$U(t,s)S(s)^{-1} = S(t)^{-1}W(t,s),([3], pp. 31,32).$$

Let us also suppose that (ii''''') is satisfied by all the $A_n$, uniformly in $n$. We will use the obvious notation $S_n, B_n, C_n, U_n(t,s), W_n(t,s)$, etc. The space $Y$ is assumed to be common to all $A_n$.

**Theorem 3.4.** In addition to the above assumptions, suppose that

(i) $B_n(t) + C_n(t) \rightarrow B(t) + C(t)$ strongly in $B(X)$ for a.e. $t \in I$

(ii) $\lim_{K \to \infty} \int_{\{|B_n+C_n| > K\}} ||B_n(t) + C_n(t)||dt = 0$

(i.e., the collection of functions $\{B_n(t) + C_n(t)\}$ is uniformly integrable)

(iii) $S_n(t) \rightarrow S(t)$ strongly in $B(Y,X)$ uniformly in $t \in I$.

Then, $U_n(t,s) \rightarrow U(t,s)$ strongly in $B(Y)$, uniformly in $(t,s) \in \Delta$.

**Proof:** Write $U(t,s)$ in the form $S(t)^{-1}W(t,s)S(s)$ and also $U_n(t,s)$ as $S_n(t)^{-1}W_n(t,s)S_n(s)$. Then,

$$||U_n(t,s)y - U(t,s)y||_Y =$$

$$= ||S_n(t)^{-1}W_n(t,s)S_n(s)y - S(t)^{-1}W(t,s)S(s)y||_Y$$

$$\leq ||S_n(t)^{-1}W_n(t,s)S_n(s)y - S(t)^{-1}W_n(t,s)S(s)y||_Y$$
+ \|S_n(t)^{-1}W_n(t,s)S(s)y - S_n(t)^{-1}W(t,s)S(s)y\|_Y \\
+ \|S_n(t)^{-1}W(t,s)S(s)y - S(t)^{-1}W(t,s)S(s)y\|_Y \\
\leq \|S_n(t)^{-1}\|_{X,Y} \|W_n(t,s)\|_{X,X} \|S_n(s)y - S(s)y\|_X \\
+ \|S_n(t)^{-1}\|_{X,Y} \|W_n(t,s)S(s)y - W(t,s)S(s)y\|_X \\
+ \|S_n(t)^{-1}W(t,s)S(s)y - S(t)^{-1}W(t,s)S(s)y\|_Y.

From Theorem 3.3 we have \|S_n(t)^{-1}\|_{X,Y} is bounded. Using a Volterra-type estimate as in Chapter 2, we have \|W_n(t,s)\|_{X,X} bounded. Then since S_n(t) + S(t) strongly in B(Y,X), uniformly in t, we have \|S_n(t)^{-1}\|_{X,Y} \|W_n(t,s)\|_{X,X} \|S_n(s)y - S(s)y\|_X \to 0 uniformly in s. Since S_n(t) + S(t) strongly in B(Y,X), S_n(t)^{-1} \to S(t)^{-1} strongly in B(X,Y), so \|S_n(t)^{-1}W(t,s)S(s)y - S(t)^{-1}W(t,s)S(s)y\|_Y \to 0 uniformly in t.

Thus it is sufficient to show that 
\|W_n(t,s)x - W(t,s)x\|_X \to 0 uniformly in (t,s) \in A.

We have $W(t,r)x = U(t,r)x + \int_r^t W(t,s)[B(s) + C(s)]U(s,r)x \, ds,$

$W_n(t,r)x = U_n(t,r)x + \int_r^t W_n(t,s)[B_n(s) + C_n(s)]U(s,r)x \, ds,$

so $W_n(t,r)x - W(t,r)x = U_n(t,r)x - U(t,r)x$

$\quad + \int_r^t W_n(t,s)[B_n(s) + C_n(s)][U_n(s,r)x - U(s,r)x] \, ds$

$\quad + \int_r^t W_n(t,s) \{[B_n(s) + C_n(s)]U(s,r)x -$ $[B(s) + C(s)]U(s,r)x\} \, ds$
\[ + \int_r^t [W_n(t, s) - W(t, s)][B(s) + C(s)]U(s, r)x\,ds. \]

Let \( V_n(t, r)x = U_n(t, r)x - U(t, r)x \)
\[ + \int_r^t W_n(t, s)[B_n(s) + C_n(s)][U_n(s, r)x - U(s, r)x]ds \]
\[ + \int_r^t W_n(t, s) \{[B_n(s) + C_n(s)]U(s, r)x - [B(s) + C(s)]U(s, r)x} \, ds; \]

then, \( ||V_n(t, r)x||_X \leq ||U_n(t, r)x - U(t, r)x||_X \)
\[ + ||W_n(t, s)||_\infty,X ||U_n(\cdot, \cdot)x - U(\cdot, \cdot)x||_\infty,X \int_r^t |B_n(s) + C_n(s)||_X| ds \]
\[ + ||W_n(t, s)||_\infty,X \int_r^t ||[B_n(s) + C_n(s)]U(s, r)x - [B(s) + C(s)]U(s, r)x||_X \, ds. \]

Since \( U_n \to U \) strongly in \( X \), uniformly in \((t, s) \in A\),
\( U_n \to U \) strongly in \( \infty,X \) norm, and \( B_n(s) + C_n(s) \to B(s) + C(s) \)
strongly, with \( B_n(s) + C_n(s) \) uniformly integrable, so by
the generalized Lebesque theorem \[10\] \( B_n(s) + C_n(s) \to B(s) + C(s) \) in \( L_1 \) norm, we then have \( ||V_n(t, r)x||_X \to 0 \) as \( n \to \infty \), for every \( x \in X \).

Thus we have \( W_n(t, r)x - W(t, r)x \) written as
\( W_n(t, r)x - W(t, r)x = V_n(t, r)x \)
\[ + \int_r^t [W_n(t, s) - W(t, s)][B(s) + C(s)]U(s, r)x\,ds. \]

Let \( Z_n(t, r)x = W_n(t, r)x - W(t, r)x \), and \( D(s) = B(s) + C(s) \).
Note \( |||D|||_1 = \int_1 \|D(\cdot)||_X, X \, dt. \)
Then, \( Z_n(t, r)x = V_n(t, r)x + \int_r^t Z_n(t, s)D(s)U(s, r)x\,ds \)
or \( V_n(t, r)x = Z_n(t, r)x - \int_r^t Z_n(t, s)D(s)U(s, r)x\,ds \)
\[ V_n(t,r)x = [I - \{DU\}]Z_n(t,r)x \]
\[ Z_n(t,r)x = [I - \{DU\}]^{-1}V_n(t,r)x \]

where \([I - \{DU\}]^{-1} = \sum_{j=0}^{\infty} \{DU\}^j\).

So \[ ||Z_n(t,r)x||_X \leq ||V_n(t,r)x||_X \sum_{j=0}^{\infty} ||\{DU\}^j||_\infty \].

Then by Theorem 2.1 we have
\[ ||Z_n(t,r)x||_X \leq ||V_n(t,r)x||_X \sum_{j=0}^{\infty} \frac{1}{j!} ||D||_1 ||U||_\infty \]
\[ = ||V_n(t,r)x||_X e^{||D||_1 ||U||_\infty} \]

which approaches zero as \(n \to \infty\).

Thus, \[ ||U_n(t,s)y - U(t,s)y||_Y \to 0. \]

Recall that we have the following mild solutions to the nonhomogeneous differential equations:
\[ u(t) = U(t,a)\phi + \int_a^t U(t,s)f(s)ds \]

and
\[ u_n(t) = U_n(t,a)\phi_n + \int_a^t U_n(t,s)f_n(s)ds, \]

and we also have \(U(t,s)S(s)^{-1} = S(t)^{-1}W(t,s)\) which we will use in the form \(S(t)U(t,s) = W(t,s)S(s)\). Also, of course, the analogous relationships \(S_n(t)U_n(t,s) = W_n(t,s)S_n(s)\) hold.

The following theorem gives an estimate of the difference between \(u_n(t)\) and \(u(t)\), this time in \(Y\) norm.
Theorem 3.5. Let $\phi_n, \phi \in Y$ and $f_n, f \in L_1(Y)$. Then
\[
\|u_n - u\|_{Y, X} \leq K \left\{ \| (S - S_n) u \|_{Y, X} + \| (W_n - W) S(0) \phi \|_{Y, X} \right. \\
\left. + \| (W_n - W) f \|_{1, Y} \right\}
\]
\[
+ M \left\{ \| S_n \|_{Y, X} \left[ \| \phi_n - \phi \|_Y + \| f_n - f \|_{1, Y} \right] \\
+ \| (S_n(0) - S(0)) \phi \|_X + \| (S_n - S) f \|_{1, X} \right\},
\]
where $K$ and $M$ depend only on the norms of $S_n^{-1}$ and $W_n$.

Proof:

\[
S_n(t)u_n(t) = S_n(t)u_n(t, 0)\phi_n + \int_0^t S_n(t)u_n(t, s)f_n(s)ds
\]
\[
= W_n(t, 0)S_n(0)\phi_n + \int_0^t W_n(t, s)S_n(s)f(s)ds.
\]

Also, $S(t)u(t) = W(t, 0)S(0)\phi + \int_0^t W(t, s)S(s)f(s)ds$.

So, $(S_n(t)u_n(t) - S(t)u(t))$
\[
= W_n(t, 0)S_n(0)\phi_n + \int_0^t W_n(t, s)S_n(s)f_n(s)ds
\]
\[
+ W_n(t, 0)S_n(0)\phi + \int_0^t W_n(t, s)S_n(s)f(s)ds
\]
\[
- W_n(t, 0)S_n(0)\phi - \int_0^t W_n(t, s)S_n(s)f(s)ds
\]
\[
+ W_n(t, 0)S(0)\phi + \int_0^t W_n(t, s)S(s)f(s)ds
\]
\[
- W_n(t, 0)S(0)\phi - \int_0^t W(t, s)S(s)f(s)ds
\]
\[
- W(t, 0)S(0)\phi - \int_0^t W(t, s)S(s)f(s)ds.
\]

Then, $\|S_n(t)u_n(t) - S(t)u(t)\|_X \leq$
\[
\|W_n\|_{Y, X, X} \|S_n\|_{Y, X, X} \|\phi_n - \phi\|_Y
\]
\[
+ \|W_n\|_{Y, X, X} \|S_n\|_{Y, X, X} \|f_n - f\|_{1, Y}
\]
We have

\[ u_n(t) - u(t) = S_n(t)^{-1} S_n(t)(u_n(t) - u(t)), \]

so

\[ ||u_n(t) - u(t)||_{\infty, Y} \leq ||S_n^{-1}||_{\infty, X, Y} ||S_n(t)(u_n(t) - u(t))||. \]

Then

\[ ||S_n^{-1}||_{\infty, X, Y} \left[ ||S(t)u(t) - S_n(t)u(t)||_X + ||(W_n - W)S(0)\phi||_X \right] \]

+ \[ ||(W_n - W)Sf||_X \]

+ \[ ||S_n^{-1}||_{\infty, X, Y} \left[ ||W_n||_{\infty, X, Y} \left[ ||S_n||_{\infty, X, Y} \left[ ||\phi_n - \phi||_Y \right] \right] + ||S_n||_{\infty, X, Y} \left[ ||f_n - f||_Y \right] \right. \]

+ \[ ||(S_n(0) - S(0))\phi||_X + ||(S_n - S)f||_X \].

Then with \( K = ||S_n^{-1}||_{\infty, X, Y} \) and \( M = ||S_n^{-1}||_{\infty, X, Y} ||W_n||_{\infty, X, X} \)

the result follows. //

Now we present some conditions under which \( u_n(t) \) will converge to \( u(t) \) in \( Y \) norm.
Theorem 3.6. If, in addition, \( \phi_n \to \phi \) in \( Y \) and \( f_n \to f \) in \( L_1(Y) \), then \( u_n \to u \) in \( Y \).

Proof: We have \( S_n \) converging strongly to \( S \), so

\[
\| S(t)u(t) - S_n(t)u(t) \|_X \text{ approaches zero as } n \to \infty.
\]

Also we have, from Theorem 3.5,

\[
\| S_n(t)u_n(t) - S(t)u(t) \|_X \leq \| W_n \|_{\infty, X, X} \| S_n(0)\phi - S(0)\phi \|_X \\
+ \| W_n \|_{\infty, X, X} \| S_n \|_{\infty, Y, X} [\| \phi_n - \phi \|_Y + \| f_n - f \|_{L_1, Y}] \\
+ \| W_n(t, 0)S(0)\phi - W(t, 0)S(0)\phi \|_X \\
+ \| W_n \|_{\infty, X, X} \int_0^t \| S_n(s)f(s) - S(s)f(s) \|_X \, ds \\
+ \int_0^t \| W_n(t, s)S(s)f(s) - W(t, s)S(s)f(s) \|_X \, ds.
\]

Since \( W_n \to W \) strongly in \( X \) (shown in Theorem 3.4) the first three terms in the above expression approach zero as \( n \to \infty \).

Then \( S_n(s)x \) converges to \( S(s)x \) for every \( s \in I \), so

\[
\sup_{s \in I} \| S_n(s)x - S(s)x \| \to 0 \
\sup_{s \in I} \| S_n(s)x \| \leq \sup_{s \in I} \| S(s)x \| + \varepsilon \text{ for every } \varepsilon > 0. 
\]

We have \( \sup_{s \in I} \| S(s) \| \leq M \), which implies

\[
\| S_n(s)f(s) - S(s)f(s) \| \leq 2M \| f(s) \|.
\]

Thus, by Lebesque's dominated convergence theorem ([4], p.151) \( \int \| S_n(s)f(s) - S(s)f(s) \| \, ds \) approaches zero as \( n \to \infty \).

Since \( \| W_n(t, s) \| \) is also bounded, the same argument gives \( \int \| W_n(t, s)S(s)f(s) - W(t, s)S(s)f(s) \| \, ds \) approaches zero as \( n \to \infty \).
Thus $||S_n(t)u_n(t) - S(t)u(t)|| \to 0$ as $n \to \infty$. Hence,

$$||u_n(t) - u(t)||_Y \leq ||S_n(t)^{-1}||_{X,Y} ||S_n(t)(u_n(t) - u(t))||_X \leq ||S_n(t)^{-1}||_{X,Y} ||S(t)u(t) - S_n(t)u(t)||_X + ||S_n(t)u_n(t) - S(t)u(t)||_X$$

which approaches zero as $n \to \infty$. //
